

TavSin White Paper

Policy-enforced smart wallets for AI agents on Sola

Architecture

- Custody lives in wallet state, not in the agent.
- Policies arbitrate execution before signing.
- Every approval and denial is recorded on-chain.

Trust model

- Owners control freeze and recovery decisions.
- Upgrade authority and incident roles must be explicit.
- Security review is required before mainnet launch.

Current boundary

- Devnet live, mainnet pending launch gates.
